

Abstract

A heat-sensitive stencil sheet is provided, which is inhibited from jamming at the time of carrying or creasing at the time of winding around a drum, and thus excellent in carrying property and winding property. This heat-sensitive stencil sheet comprises a laminate of a thermoplastic resin film and a porous substrate mainly composed of synthetic fibers, and satisfies $0.150 \leq T-H$ wherein T denotes an arithmetic average value ($\text{g}\cdot\text{cm}/\text{cm}$) of absolute values of KES bending torque in lengthwise direction of the stencil sheet at curvatures of $+2.3$ and -2.3 cm^{-1} , H denotes a bending hysteresis ($\text{g}\cdot\text{cm}/\text{cm}$), and T-H denotes a residual torque ($\text{g}\cdot\text{cm}/\text{cm}$).
